Experiment No. 6
Apply Boosting Algorithm on Adult Census Income Dataset and analyze the performance of the model
Date of Performance: 05-10-2023
Date of Submission: 12-10-2023

Vidyavardhini's College of Engineering & Technology

Department of Computer Engineering

Aim: Apply Boosting algorithm on Adult Census Income Dataset and analyze the performance of the model.

Objective: Apply Boosting algorithm on the given dataset and maximize the accuracy, Precision, Recall, F1 score.

Theory:

Suppose that as a patient, you have certain symptoms. Instead of consulting one doctor, you choose to consult several. Suppose you assign weights to the value or worth of each doctor's diagnosis, based on the accuracies of previous diagnosis they have made. The final diagnosis is then a combination of the weighted diagnosis. This is the essence behind boosting.

Algorithm: Adaboost- A boosting algorithm—creates an ensemble of classifiers. Each one gives a weighted vote.

Input:

- D , a set of d class labelled training tuples
- k , the number of rounds (one classifier is generated per round)
- a classification learning scheme

Output: A composite model

Method

1. Initialize the weight of each tuple in D is $1/d$
2. For $i=1$ to k do // for each round
3. Sample D with replacement according to the tuple weights to obtain D_i
4. Use training set D_i to derive a model M_i
5. Compute $\text{error}(M_i)$, the error rate of M_i
6. $\text{Error}(M_i) = \sum w_j * \text{err}(X_j)$
7. If $\text{Error}(M_i) > 0.5$ then
8. Go back to step 3 and try again
9. endif
10. for each tuple in D_i that was correctly classified do
11. Multiply the weight of the tuple by $\text{error}(M_i)/(1-\text{error}(M_i))$
12. Normalize the weight of each tuple
13. end for

To use the ensemble to classify tuple X

1. Initialize the weight of each class to 0
2. for $i=1$ to k do // for each classifier
3. $w_i = \log((1 - \text{error}(M_i)) / \text{error}(M_i))$ // weight of the classifiers vote
4. $C = M_i(X)$ // get class prediction for X from M_i
5. Add w_i to weight for class C
6. end for
7. Return the class with the largest weight.

Dataset:

Predict whether income exceeds \$50K/yr based on census data. Also known as "Adult" dataset.

Attribute Information:

Listing of attributes:

>50K, <=50K.

age: continuous.

workclass: Private, Self-emp-not-inc, Self-emp-inc, Federal-gov, Local-gov, State-gov, Without-pay, Never-worked.

fnlwgt: continuous.

education: Bachelors, Some-college, 11th, HS-grad, Prof-school, Assoc-acdm, Assoc-voc, 9th, 7th-8th, 12th, Masters, 1st-4th, 10th, Doctorate, 5th-6th, Preschool.

education-num: continuous.

marital-status: Married-civ-spouse, Divorced, Never-married, Separated, Widowed, Married-spouse-absent, Married-AF-spouse.

Department of Computer Engineering

Conclusion:

1. The GradientBoostingClassifier has the highest accuracy (0.8690) and F1 score (0.7219) among the three classifiers, indicating that it performs the best on this dataset.
2. The AdaBoostClassifier and XGBClassifier also have good performance but slightly lower than the GradientBoostingClassifier in terms of accuracy and F1 score.
3. All three classifiers have relatively high precision, indicating that when they predict a positive class (1), they are often correct.
4. The recall values vary among the classifiers, with the GradientBoostingClassifier having the highest recall for the positive class (1), indicating that it correctly identifies more positive cases.
5. The F1 score, which balances precision and recall, shows how well the classifiers perform in classifying both classes.

Comparison between boosting algorithms and random forest classifier:

1. The boosting algorithms (AdaBoost, Gradient Boosting, and XGBoost) generally outperform the Random Forest Classifier in terms of accuracy, precision, and F1 score.
2. The Random Forest Classifier performs reasonably well, with an accuracy of around 85% and a balanced F1 score. However, it falls slightly behind the boosting algorithms.
3. The boosting algorithms tend to have higher precision and recall for the positive class (income > 50K), indicating better ability to correctly classify high-income individuals.

All these models perform reasonably well on the Adult Census Income Dataset; the boosting algorithms, especially Gradient Boosting, appear to provide slightly better results in terms of accuracy and F1 score compared to the Random Forest Classifier.
